

MailFrontier delivers leading email protection with its innovative, best-in-industry Preemptive Scanning MTA™.

Preemptive Scanning MTA differs from other MTAs where disk I/O slows email performance. Junk email now accounts for 50 to 90 percent of typical inbound traffic, so every email message in or out of an organization must be scanned for threats and policy violations. But with most MTAs, messages have already been accepted, queued, and written to disk before they are filtered.

On Disk Analysis:
Junk email consumes disk I/O and slows MTA throughput

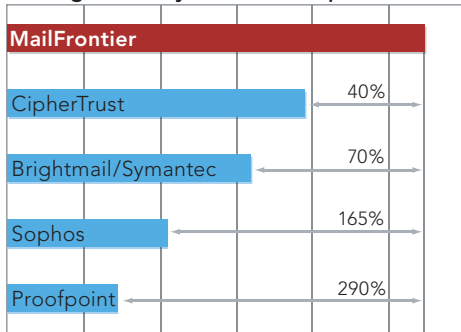

- The results of most MTAs?**
- Unnecessary processing and disk I/O for junk email
 - Slowing of legitimate email
 - Compromised MTA performance
 - The added expense of more servers to handle load

Preemptive Scanning MTA: Proven Performance

MailFrontier Preemptive Scanning MTA was put to the test in a recent industry review. This independent verification of MailFrontier's message delivery shows a rate 40 to 290 percent better than competitive products¹.

Message Delivery Rate: 40-290 percent faster

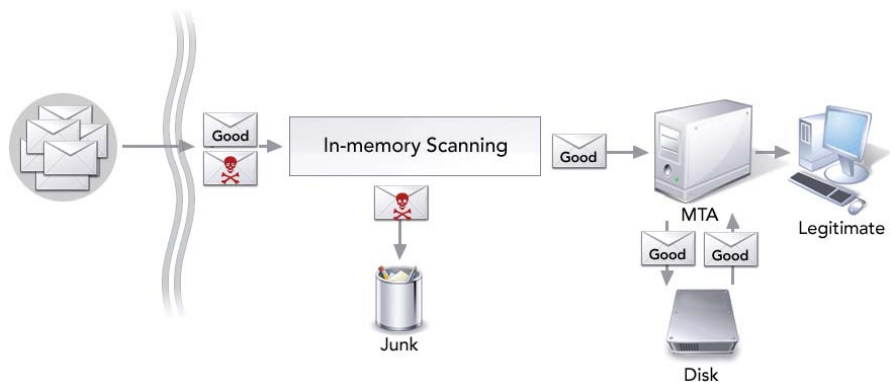

¹Delivery rate, msg/sec, Network World, Analyzing the Spam Test Results, 12/20/04

MailFrontier's best-in-class message delivery rate means inbound and outbound corporate email reaches its intended recipients faster. Higher performance means fewer servers, easier management, and lower cost.

MailFrontier Preemptive Scanning MTA only accepts and queues messages that have successfully passed through MailFrontier filters—meaning only legitimate messages are processed by our MTA. Junk messages—the majority of today's email—are never processed by the MTA. Instead, they are instantly deleted, bounced, rejected, or quarantined with no effect on delivery or throughput.

MailFrontier Preemptive Scanning MTA:
Eliminates junk prior to disk I/O, thus assuring a rapid email delivery rate

MailFrontier Gateway provides multiple message delivery options including:

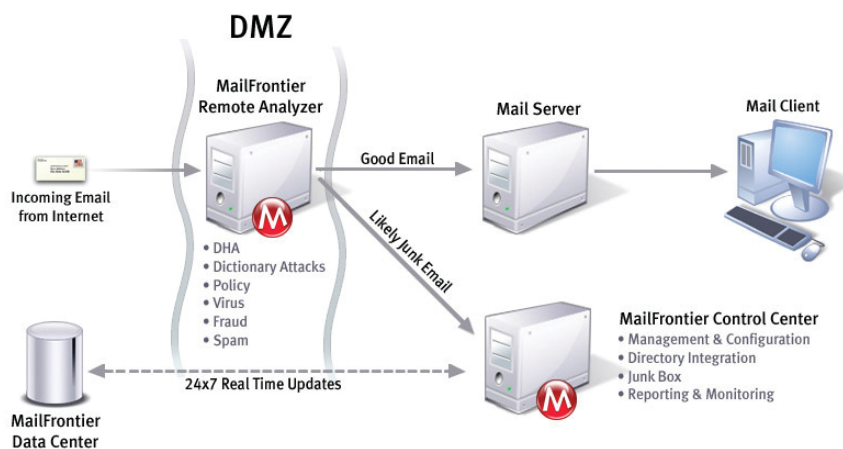

- Preemptive scan with direct delivery of messages to an email server
- Preemptive scan with queuing of messages for delivery to an email server
- Preemptive scan with queuing and routing by domain, LDAP, or MX record to multiple email servers

Scaling and High Availability to Meet Enterprise Needs

MailFrontier can run as a single all-in-one product that easily handles all scanning, quarantining, and management. Or, MailFrontier can deploy in high-availability, multi-system environments with Remote Analyzer option.

For the scalability, redundancy and high availability needs of large enterprises, MailFrontier Remote Analyzers enable distributed processing and management. In this configuration, MailFrontier Remote Analyzers are deployed at the perimeter of the company to rapidly scan incoming email. A separate Control Center is configured to handle the management of the MailFrontier system.

MailFrontier's scalable architecture with MailFrontier Remote Analyzer

All MailFrontier Remote Analyzers can delete, bounce, reject, or quarantine unwanted mail while permitting legitimate email to pass through untouched to its destination. MailFrontier Remote Analyzers can also be deployed in multiple, globally-distributed data centers to provide complete scalability and redundancy. New Remote Analyzers can be dropped in with no new set-up configuration.

MailFrontier Email Security:

- **Best Protection**
 - From External Threat
 - Against Internal Threats
 - With Policy Management
- **Effortless Control**
 - Quick & Flexible Configuration
 - Hands-off Maintenance
 - Streamlined User/Group Mgmt
- **High Performance**
 - Delivery rates up to 290% faster than the competition¹

Email Security Made Effortless

MailFrontier's email security technology is running at over a thousand enterprises. With MailFrontier, you get effortless control over your email, including:

- Centralized management across all servers
- Scalability and redundancy utilizing Remote Analyzers
- Dashboard and detailed reporting on MTA status and health across all servers
- Integrated protection from spam, viruses, phishing, DHA, DOS, zombies, and other threats

E-mail security alone isn't enough. Security without performance or manageability will stifle a company's business. Only MailFrontier gives you the comprehensive email security you need in a system architected for performance. MailFrontier's Preemptive Scanning MTA sets the industry standard for real-world message delivery rate. Architectural flexibility give the power to cost effectively scale to any email load with effortless configuration, management, and control of the entire system. With MailFrontier, email is good again.
