

MailFrontier
Email is good again.™

MailFrontier Enterprise Gateway™

Anti-Fraud Module

“One successful instance of email fraud could result in a breach of network security which lays bare an infrastructure, its information, its users, and its customers to the criminal or malicious imagination of every spammer, hacker, and thief.”

Features

- Detection of fraud with 100 percent certainty
- Option to delete fraud email at the perimeter
- Immediate differentiation and segregation of fraud from spam and other email threats
- Distinct fraud reporting, alert, and feedback tools to keep IT aware of trends

Email fraud enters the enterprise

Email fraud is no longer a consumer problem. Now an urgent enterprise security threat, fraudulent email steals corporate information through the “soft underbelly” of well-intentioned employees and renders IT security defenses useless. Each year, corporations are swindled out of billions of dollars in money and thousands of hours in time by fraudulent email attacks, attacks that go beyond the now well-known “phishing” scams. And as Internet scams become more and more sophisticated, one thing is clear: **every company is vulnerable to email fraud.**

Anti-spam filters do not help

Fraud is not simply spam or malicious programming; it is a targeted and malicious criminal attack on the enterprise that requires specific attention and action. Intended to look identical to legitimate emails from respected companies, fraudulent emails are not caught by anti-spam filters, which are specifically designed to let such emails into the organization.

MailFrontier Anti-Fraud Module: The right response to fraud

The MailFrontier Enterprise Gateway provides the only solution that is uniquely designed to identify, capture, and take action on fraudulent emails. It includes statistical filtering methods specifically developed to evaluate fraudulent content. The MailFrontier Anti-Fraud module also analyzes for fraudster obfuscation techniques, tests for system exploits, and checks against MailFrontier’s database of fraudulent contact points. Fraudulent emails are caught and identified distinctly from spam and other threats. To educate your team on future threats, MailFrontier Anti-Fraud module can alert selected individuals such as IT or end-users

of fraud outbreaks in the wild. Finally, for auditing and security, MailFrontier Anti-Fraud module can assemble copies of all fraudulent emails entering the enterprise. MailFrontier provides complete, self-running protection against fraudulent email.
